

Simple Schema Reference

A horizontal definition gives a new name to an existing schema or schema expression without creating a new boxed schema paragraph.

$$\boxed{\begin{array}{l} \textit{Counter} \\ n : \mathbb{N} \end{array}}$$

Plain *alias* : *CounterRef* is definitionally equal to *Counter*.

$$\textit{CounterRef} \hat{=} \textit{Counter}$$

Inline schema text: a compact one-line schema form.

$$\textit{NatPair} \hat{=} [x : \mathbb{N}; y : \mathbb{N} \mid x < y]$$

Multi - predicate Inline Text

Multiple predicates within the inline text are separated by semicolons and joined with logical-and in the output.

$$\textit{BoundedNat} \hat{=} [n : \mathbb{N} \mid n > 0 \wedge n < 100]$$

Generic LHS

The LHS may carry generic type parameters for parameterised horizontal definitions per Z RM §3.8.

$$\boxed{\begin{array}{l} \textit{GenStack}[X] \\ \textit{top} : X \end{array}}$$

$$\textit{StackAlias}[X] \hat{=} \textit{GenStack}[X]$$
