

String Literals in Z

In database modelling, constants often have string values. The `txt2tex` lexer recognises single-quoted strings as literal values distinct from identifiers.

A string literal like `'sunk'` or `'survived'` is a concrete value. When used in Z expressions, it renders with Z-convention quoting: backtick open, apostrophe close.

In this TEXT block, the apostrophes appear as written. In a Z expression block such as an `axdef` or schema predicate, `'sunk'` would render as the Z string form.
